Has this file been identified as malicious? Explain why or why not.

Yes, this file has been identified as malicious. 52 of 70 security vendors flagged the SHA256 hash, and the file has a community score of -296. Vendors consistently label it a trojan in the Flagpro/Fragtor family; for example, Alibaba detects it as Backdoor:Win32/Kryptik, BitDefender as Gen:Variant.Fragtor, and CrowdStrike Falcon reports it as malicious with 100% confidence. VirusTotal's code insights describe it as a backdoor and credential-stealing trojan that contacts org.misecure.com for instructions, downloads secondary payloads, and exfiltrates stolen data over HTTP. The high vendor ratio, negative community score, and consistent malware detections all point to the same conclusion.
